Build Your Dream Home WITH LESTER BUILDINGS

Lester Buildings post-frame construction is very versatile and is ideal for building incredibly beautiful homes.

In addition to the traditional home, “shouses” (shop + house) and “shomes” (shop + home) are very popular. Live, work and play in one building!

BUILT TO Last

Backed by a Lifetime Structural Warranty, Lester Buildings are engineered and built to last a lifetime.

Fast, Efficient CONSTRUCTION

Lester Buildings post-frame homes go up much faster than a traditional home because a foundation or basement is not required. Steel roofing and siding is also faster to apply than traditional home exteriors.

Energy EFFICIENT

Lester Buildings post-frame homes are easy to insulate. They provide better energy efficiency than traditional homes since there are fewer thermal breaks. The design is flexible to accommodate any type of insulation or HVAC system.

“I am pleased with the product and the craftsmanship on our cabin. Our expectations were met and then exceeded with this project! I highly recommend Lester Buildings to anyone considering a building project. Our experience could not have been more positive.” - Rion R., Project 270116

BEAUTIFUL, VERSATILE AND CUSTOM

Lester Buildings post-frame construction offers open floor plan designs and limitless custom options to create a beautiful, warm living space that is uniquely you.

Any interior or exterior design element that is typically found in a traditional home can be included in a Lester Buildings post-frame home. There is no need to rely on interior posts or load bearing walls for structural support. Lester Buildings post-frame construction allows up to a 120’ wide clear span space. **It’s possible to build that dream home you’ve always imagined.**

BUDGET FRIENDLY

Compared to a traditionally framed home, labor and materials typically cost less for a Lester Buildings post-frame home.

Because there is no need for interior posts or load bearing walls, adding or removing walls or even adding a second floor (depending on the height of the frame) is much easier and more cost effective than with a traditional house. Adding extras like a porch or walk-in closet is possible without substantially raising the overall cost. The best part is that, over time, it costs less to maintain steel compared to traditional siding and asphalt or cedar shingles.

ECLIPSE ROOF SYSTEM™

Beauty meets functionality. Smartly designed with unmatched curb appeal, the patented* Lester Buildings Eclipse Roof System is strong and sleek with no leaks. The attractive batten snaps over the roof ribs, concealing the screws, making it weathertight. A perfect choice for your dream home!

*U.S. Patent No. 9,127,451 B1 | Canadian Patent No. 2,901,202

GETTING STARTED

First check into the zoning and building code requirements for the city and county where your building will be constructed. Be sure that your property is zoned for your Lester post-frame home.

Then have your preliminary house plan ready when you talk with your Lester representative. There are many resources available online to help you find your ideal building plan.

Lester Buildings or one of its dealers will handle the construction of the exterior (shell) of your building to ensure that it is structurally sound and built to last a lifetime. Many Lester dealers can act as a turn-key general contractor and handle your project from start to finish. The Lester process allows you to do it yourself or have the finishing contractors of your choice.
